

Data Science Research Assignment 1

Due Date : 22 May 2026

Lecturer : Lerato Motsusi

Student : Problem Zindove

Question 1

A database is a digitalised system that collects, manages and stores data in an organised format. It comprises both the hardware where data is stored and the system where data is organised and access is controlled. Different types of data is stored in different formats and support a large amount of complex queries.

Databases are important in the modern world because:

- * Data has become more available and it needs to be managed for it to be useful
- * It makes it easy and efficient to manage data for quick and effective decision making

Databases are used for:

- * New product development
- * Financial statements

Question 2

Data warehouse is a centralised digital repository that aggregates different databases, clean and prepare it for further analysis.

- It differs from a database because it contains large amounts of data and the data spans over a long period.
