

Question 11

Artificial Intelligence (AI) is where machines simulate human intelligence. This includes learning, reasoning and self correction.

- It is categorised in two, namely weak and strong AI.

a) Weak / Narrow AI

These are AI models trained to perform specific tasks. It operates within the context of the tasks that it is programmed to perform and it cannot be generalised broadly beyond what it was programmed to do.

- For example Siri for Apple, Alexa for Amazon.

b) Strong / General AI

It is AI that is capable of performing any intellectual task that can be done by any human being. This spans beyond the original purpose that it has been programmed to do. For example natural language processing and image recognition.
