

Question 2 continued

- A company would use a data warehouse for business intelligence, data science and data analytics

Question 3

- Data lakes are low storage environments that are designed for handling large amounts of both structured and unstructured data
- They differ from data warehouse by that, they do not clean, validate or normalize data
- A business would prefer a data lake over a data warehouse if it wants to perform big data analytics and where real-time performance is not important

Question 4

- A Data Mart is where a specific type of data is available for a specific set of users for example a department or unit
- It is related to a data warehouse in that, it is a subset of a data warehouse
- Specific users for example, the marketing department use specific data relating to their specific needs

Question 5

- Structured data
- It is data that fits into rows and columns and has a fixed schema
- It contains a predefined format and it is easy to manipulate and analyse
- Structured data is often used in machine learning to drive
