

Question 21

REST stands for Representational State Transfer. REST API is a set of design principles and constraints used to create scalable and light weight APIs. It relies on a client-server model where a client requests data and the server provides it.

Main HTTP Methods used in REST API

- a) Get - it retrieves data from a specific resource without modifying it.
- b) Post - Sends data to the server to create a new resource for example adding a new product to a database.
- c) Put - Updates or replaces an existing resource with new data.
- d) Delete - Removes a specific resource from the server for example deleting a file.

Question 22

JSON (JavaScript Object Notation) is a light weight data format exchange format used to exchange information between a client and a server. It is commonly used because it is light-weight, human readable, ease of parsing, supports complex data and is compatible across languages.
