### Question 24

~~Data~~ A MAP function is a higher order function that applies a specific transformation to every item in a collection and returns a new collection containing the results. It is used to perform uniform operations without writing manual loops in data processing and programming.

### Example python MAP

```
def add_one(x):  
    return x+1
```

```
my_list = [1, 2, 3]
```

```
mapped = map(add_one, my_list)
```

```
print(list(mapped))
```

```
Output [2, 3, 4]
```
