

Question 6 Continued - - -

Data Model Types

④ Conceptual data models

- They are domain models that are created as part of the process of gathering the initial requirements of the project. They offer an oversight of what the system will contain and how it will ~~contain~~ be organised and the business rules that will be involved. They are more of an abstract and have simple annotations.

⑤ Logical data models

- These are data models that provide depth about the relationships and the concepts in the system under consideration.

- They follow formal data modeling notations that indicate attributes such as data types and relationships.

- They are useful for projects that are data oriented, for example designing a data warehouse.

Question 7

Data mining refers to the use of machine learning and statistical analysis to discover patterns and insights from large datasets.

- It is used to organize and filter data. For example a bank can use data mining to detect fraudulent behavior and a shop can use data mining to predict seasonal customer behavior.
