

Question 16

Generative AI (GAI) is another branch of AI that creates new and original content such as images, audio, text etc. They rely on complex ML models that are trained on large amounts of data. Patterns and relationships are learnt and when given a prompt by a user the learnt patterns and relationships are used to predict and generate according to the prompt.

The most popular GAI are:

- (a) ChatGPT - you can give it a prompt to write, essays, brainstorm, code and debug
- (b) Google Gemini - generates text, codes, images and videos
- (c) Midjourney - it is a text to image generator for artistic images

Question 17

- A training dataset is the dataset that is used to teach or train an AI model how to perform a task
- Quality of the training data is important because it improves accuracy, allows for generalisation and ensures relevance
- If the data is incorrect or biased it will result in mistakes and hallucinations. It can also result in discriminatory outcomes. The concept of Garbage in Garbage out applies.
