

Question 18

- A computer vision is another branch of AI where machines are trained to process, analyze and interpret visual data

Machines see images using grids of numerical values that represent pixels. These numbers are then interpreted through a multi-step digital process where images are pre-processed and features extracted, Artificial Neural Networks are applied and patterns are recognised

Real world user cases are:

- ④ Self driving cars - cameras capture live videos of the road and AI models identify traffic signs, line markings and pedestrians or animals and other vehicles.
- ⑤ Medical Imaging where medical scans such as X-rays are analysed and anomalies are detected.

Question 19

Application Programming Interface (API) is a set of rules that allows different software applications to talk to each other

Restaurant Analogue
